

120. The diagram shows the path of a ball in the absence of air resistance. Q is the highest point of the ball's trajectory and a is the vertical acceleration at Q. At impact the velocity makes an angle θ to the horizontal.

Three statements about the actual motion of the ball when there is air resistance are:

- I. Q is lower.
- II. a remains the same.
- III. θ increases.

Which statements are correct?

- A. I and II only
- B. I and III only
- C. II and III only
- D. I, II and III
